

Data Collection Statistics

Here are some basic statistics on the data logging that I did myself to illustrate just how much data got collected and over how much time. The data was collected over portions of 9 nonconsecutive days. There ended up being 98.7 hours in which 1,200 data points of light percentages and 1,200 data points of fahrenheit temperatures were collected. The data points were collected every 5 minutes (300 seconds).
